Hi team,

We are sunsetting the custom **CommitCheck** PR status and moving to Bitbucket Cloud's native **Require issue keys in commit messages** setting.

What will change:

- Commits without a Jira ticket key, such as **RP-12345**, will be rejected at push time.
- The old PR-level **CommitCheck** status will be removed.
- The **ignore my commits** bypass comment will no longer work.

Please make sure every commit message includes a Jira ticket key.

Example of a valid commit message:

RP-12345: Fix export issue

Example of a rejected push:

```
% git push origin
```

```
remote: One of your commit messages is missing a valid issue key:
```

```
remote:
```

```
remote: 4b2a137: fix
```

```
remote:
```

```
remote: For more information, see https://support.atlassian.com/bitbucket-cloud/docs/link-to-a-web-service/
```

```
! [remote rejected] develop -> develop (pre-receive hook declined)
```

```
error: failed to push some refs
```

If this happens, please amend or rebase the commit message to include a Jira ticket key and push again.

This change gives us earlier enforcement, less custom infrastructure to maintain, and native Jira linking in Bitbucket.

Timeline:

- **This week:** Enable native Bitbucket enforcement
- **Next Monday:** Disable `pipeline-commit-checker`

If this causes an issue for your repository or automation, please reach out directly or ask in **#ci-troubleshooting**. We can temporarily disable the setting if needed.

Thanks,
Denis Nasyrov
